

Innovation by Automation

The IST Monitor comes packaged with a suite of temperature and switch sensors that have been specially selected and tested for restaurant equipment. Once the monitor is installed and activated, the magic begins. The process is summed up in three easy steps:

> DETECT DEVELOPING PROBLEMS

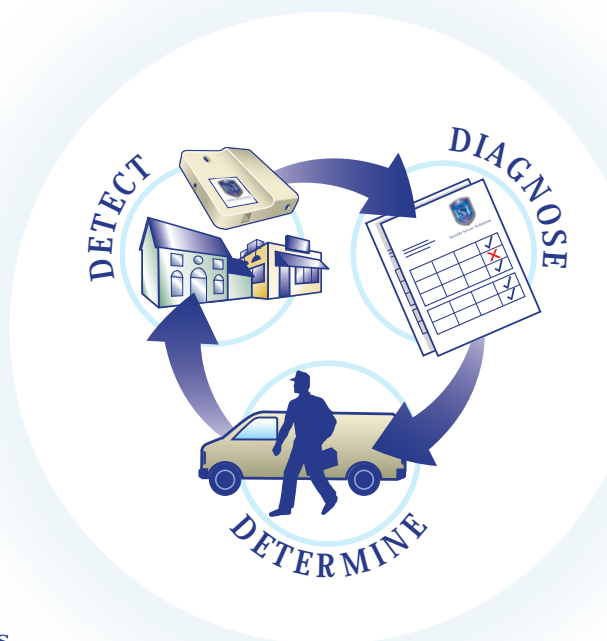

The IST Monitor continually evaluates the internal operations of your Refrigeration and HVAC systems, scanning a number of common problem areas on your equipment and reports this data to the IST Data Center. You and your contractor can remotely access these reports at any time through our web site.

> DIAGNOSE THE CAUSE

When a sensor on the IST Monitor detects any operation outside of the pre-set standards, the monitor immediately reports the information to the IST Data Center, instantly alerting you and/or your contractor by email, fax, text message and/or pager. This information is used to diagnose the severity and nature of the problem.

> DETERMINE THE COURSE OF ACTION

Once the diagnosis is made, it can be determined whether a problem requires immediate attention or a simple adjustment on a routine service call. Your contractor will contact you with a recommended course of action, ultimately preventing costly expenses such as emergency visits or complete equipment failure.

Easier on You, Easier on the Environment

San Diego Gas & Electric Company's research shows that Refrigeration and HVAC energy usage conservatively amounts to over 40% of a restaurant's utility bill and that 70% of all Refrigeration and HVAC systems under-perform. This doesn't have to be the case. Increased efficiency means reduced energy consumption and extended equipment life, saving you money and saving our environment at the same time! You will find IST listed in the GreenSpec® Directory as an environmentally-preferred energy conservation product.

Call or Visit Us on the Web
